Quantitative Analysis and Visualization

yt is more than a visualization package: it is a tool to seamlessly handle simulation output files to make analysis simple. yt can easily knit together volumetric data to investigate phase-space distributions, averages, line integrals, streamline queries, region selection, halo finding, contour identification, surface extraction and more.

Get yt

Install yt from yt-project.org

can be upgraded and operated independently of the host operating system.

Usually getting yt is as simple as running the installation script. Simply download the legacy, stable, or development version of the install script and run it. You can do this using **wget** or **curl**, or even just right click and choose **Save As**.

Carefully read the instructions the script prints to your terminal since there might be special instructions for your operating system.

Once you've downloaded it, just run:

```
$ bash install_script.sh  
$ source YT_DEST/bin/activate
```

```
$ conda install yt
```

Get yt: from source.

If you are comfortable installing Python packages and have a build environment set up, you can install yt via **pip**:

```
$ pip install yt
```

If you would like to install the development version of yt, first clone the repository:

```
$ hg clone
```

```
https://bitbucket.org/yt_analysis/yt
```

And run the following command in the root source directory:

```
$ hg update yt
```

Then do the following:

```
$ python setup.py develop
```

ENZO METHOD PAPER

ENZO: AN ADAPTIVE MESH REFINEMENT CODE FOR ASTROPHYSICS

THE ENZO COLLABORATION: GREG L. BRYAN¹, MICHAEL L. NORMAN^{2,3}, BRIAN W. O'SHEA^{4,5}, TOM ABEL^{6, 20}, JOHN H. WISE⁷, MATTHEW J. TURK¹, DANIEL R. REYNOLDS⁸, DAVID C. COLLINS⁹, PENG WANG⁶, SAMUEL W. SKILLMAN^{10,11}, BRITTON SMITH⁴, ROBERT P. HARKNESS¹², JAMES BORDNER², JI-HOON KIM¹³, MICHAEL KUHLEN^{14,15}, HAO XU², NATHAN GOLDBAUM¹⁵, CAMERON HUMMELS¹⁶, ALEXEI G. KRITSUK², ELIZABETH TASKER¹⁷, STEPHEN SKORY¹⁰, CHRISTINE M. SIMPSON¹, OLIVER HAHN¹⁸, JEFFREY S. OISHI¹⁹, GEOFFREY C SO², FEN ZHAO²⁰, RENYUE CEN²¹, AND YUAN LI¹

Draft version July 22, 2013

ABSTRACT

This paper describes the open-source code Enzo, which uses block-structured adaptive mesh refinement to provide high spatial and temporal resolution for modeling astrophysical fluid flows. The code is Cartesian, can be run in 1, 2, and 3 dimensions, and supports a wide variety of physics including hydrodynamics, ideal and non-ideal magnetohydrodynamics, N-body dynamics (and, more broadly, self-gravity of fluids and particles), primordial gas chemistry, optically-thin radiative cooling of primordial and metal-enriched plasmas (as well as some optically-thick cooling models), radiation transport, cosmological expansion, and models for star formation and feedback in a cosmological context. In addition to explaining the algorithms implemented, we present solutions for a wide range of test problems, demonstrate the code's parallel performance, and discuss the Enzo collaboration's code development methodology.

Keywords: methods: numerical — hydrodynamics

<http://adsabs.harvard.edu/abs/2014ApJS..211...19B>

WHAT IS ENZO?

Enzo is a cosmological, adaptive-mesh refinement, hydrodynamics + N-body simulation code.

Image: Eric Hallman, Brian O'Shea

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

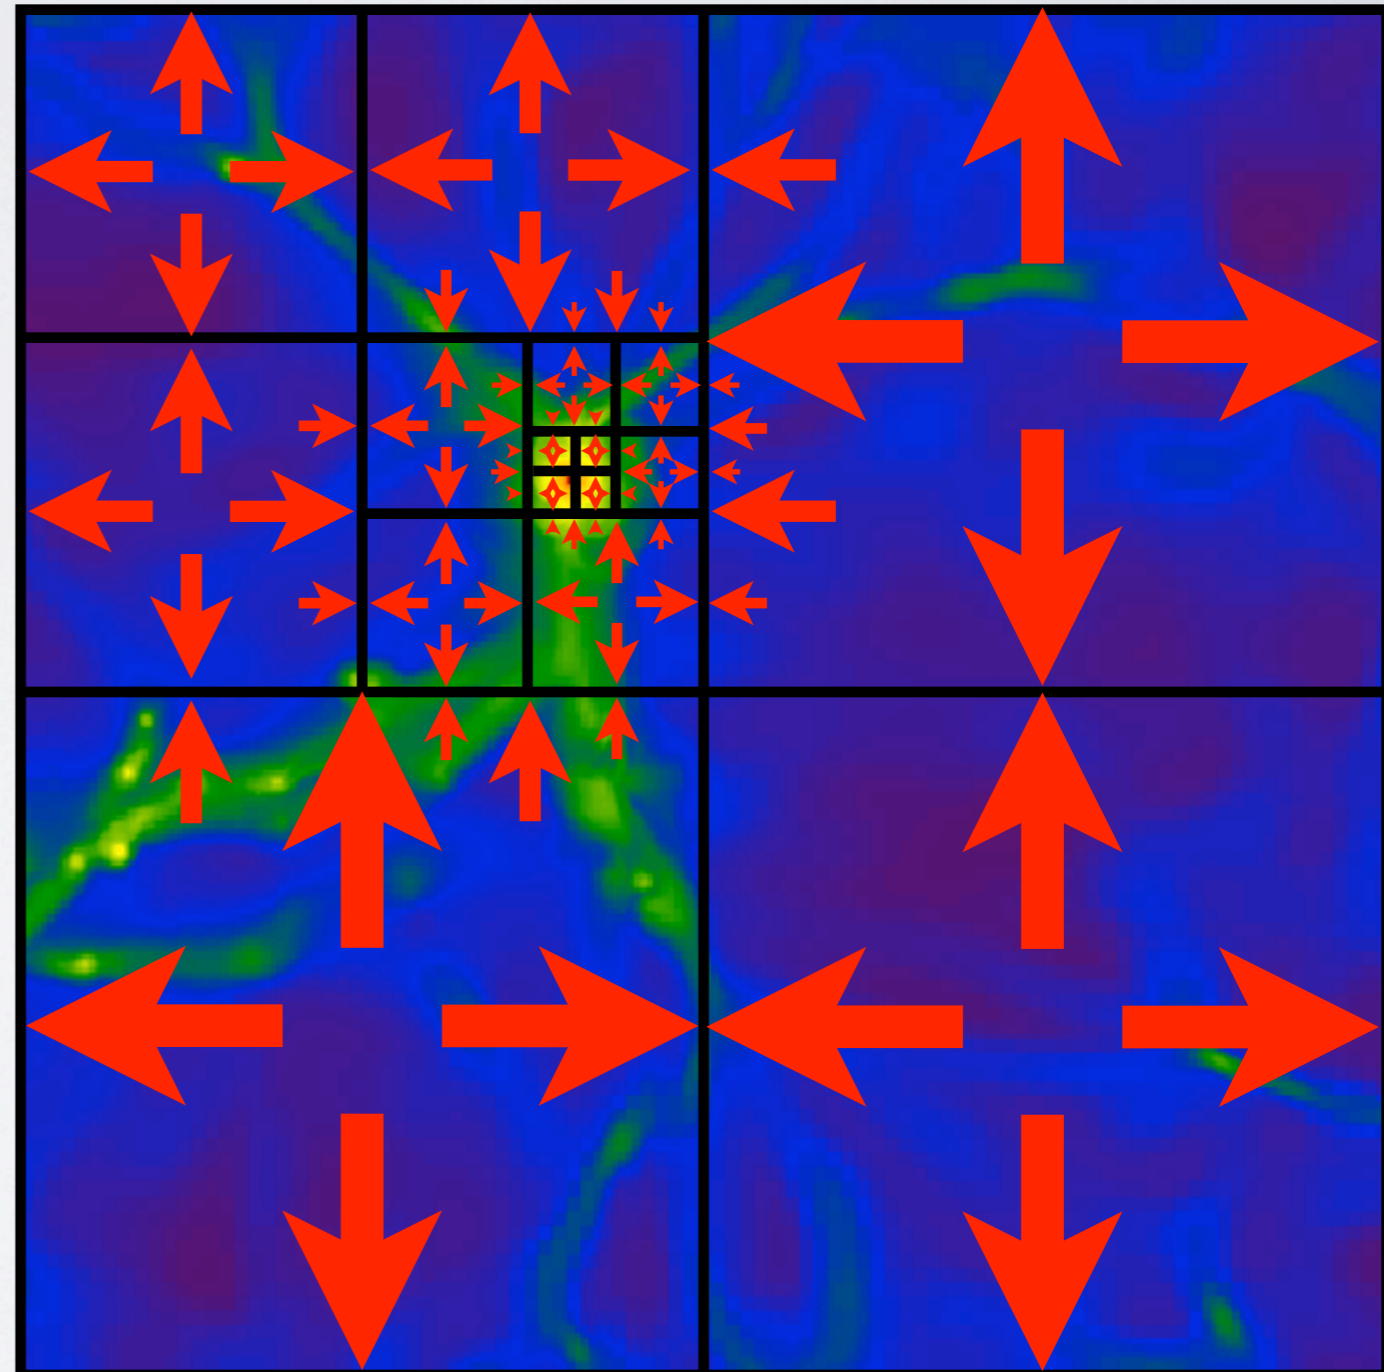

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

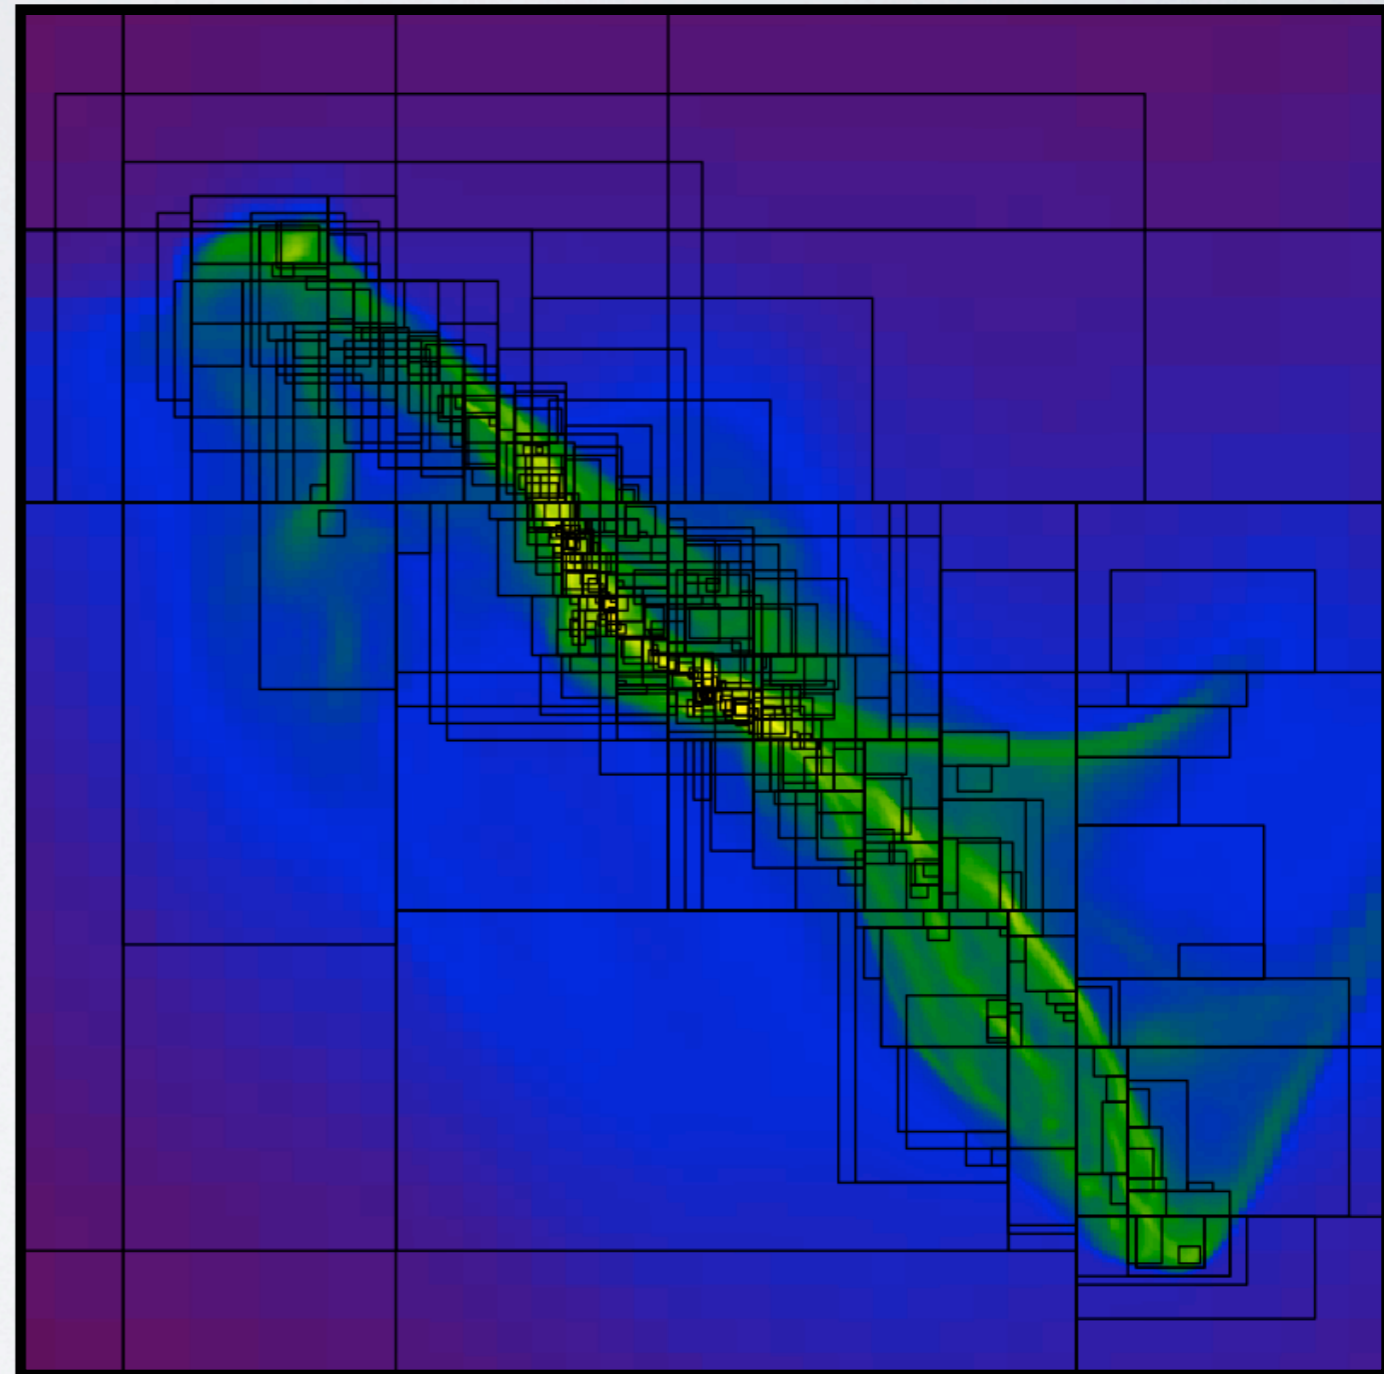

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

AMR: ADAPTIVE-MESH REFINEMENT

- create and destroy grid patches dynamically (block-structured)
- grids at multiple resolutions
- multiple refinement criteria:
 - density (gas or dark matter)
 - gradients, shocks
 - cooling time
 - Jeans length
 - refine regions around particles
- easy to create new criteria

ADAPTIVE-MESH REFINEMENT EXTREME DYNAMIC RANGE

GRAVITY

- dark matter treated as collision-less particles
- adaptive particle-mesh method
 - solve Poisson eqn.: $\nabla^2\phi = 4\pi G\rho$
 - particles interpolated onto grid to create density field, then gas densities added
 - multigrid relaxation for refined grids
- advantage: very fast!
- disadvantage: force res. is $2\Delta x$ (not great)

Image: Michael Norman et. al.

HYDRODYNAMICS

Multiple Hydro Methods

- Piecewise Parabolic Method
 - fits state variables to 3rd order parabolic
 - nonlinear Riemann solver for excellent shock capturing
 - can be unstable with cosmology or cooling (much better now)
- Zeus
 - less accurate, more diffusive
 - extremely robust (excellent for cosmology)

Image: Nick Earl

HYDRODYNAMICS

Multiple Hydro Methods

- MUSCL
 - 2nd order accurate Godunov solver
 - 2nd order Runge-Kutta time integration
 - multiple Riemann solvers and interpolation methods available

Image: Nick Earl

MHD

Multiple Hydro Methods

- Dedner
 - uses MUSCL framework above
 - hyperbolic divergence cleaning method to ensure $\nabla \cdot \mathbf{B} = 0$
 - uses cell-centered B field
- Constrained Transport
 - magnetic field updated as the curl of the electric field
 - preserves $\nabla \cdot \mathbf{B} = 0$
(since $\nabla \cdot (\nabla \times \mathbf{F}) = 0$)
 - needs face and edge-centered fields: more complicated

Enzo Method Paper

RADIATIVE TRANSFER

Two Rad.Transfer Methods

- Adaptive Ray Tracing
 - radiation from discrete sources (star and black hole particles)
 - adaptive ray splitting and merging
 - fully coupled to chemistry network
- Flux Limited Diffusion
 - treats radiation like a fluid
 - couple to atomic chemistry
 - highly scalable
 - unigrid and AMR versions available

Image: John Wise

RADIATION BACKGROUNDS

- spatially smooth, time-dependent radiation fields
- UV metagalactic, ionizing backgrounds for photo-heating and ionization during Reionization (multiple models)
- Lyman-Werner soft UV fields represent radiation from first stellar sources and photo-dissociate H_2

Image: Britton Smith

CHEMISTRY AND COOLING

- Non-equilibrium primordial chemistry
 - H, H⁺, H⁻, He, He⁺, He⁺⁺, H₂, H₂⁺, D, D⁺, HD, e⁻
 - H₂ chemistry: 2-body, 3-body channels, dust grains, chemical heating/cooling
- Metal cooling
 - simple tabulated rates ($T > 10^4$ K)
 - atomic fine-structure lines
 - Cloudy tables: density, metallicity, temperature, electron fraction, background redshift

Enzo Method Paper

CHEMISTRY AND COOLING

High temperature cooling rates at various metallicities.

One-zone model of gas collapse at various metallicities.

THERMAL CONDUCTION

Spitzer Conduction

- heat transfer through electron Coulomb interactions
- $\kappa \sim T^{5/2}$, with saturation for sharp temperature gradients
- significant for $T > 10^7$ K (galaxy clusters)
- isotropic (hydro only) and anisotropic (MHD) available
- explicit solver: $dt \sim dx^2 n / \kappa$: short timesteps!

ACTIVE PARTICLES

- act on the grid by adding or removing gas, energy, and momentum
- non-radiating star particles
 - form in dense, collapsing, cooling gas
 - inject thermal energy, metals into nearby grid cells
- radiating star and black-hole particles form the same way and emit radiation
- sink particles accrete nearby gas like collapsing protostars

Image: John Wise

TRACER PARTICLES

- can be placed anywhere in a simulation
- used to trace hydrodynamic flow
- output field values in which particles exist
- output separately from main dataset: can be output with higher frequency

Image: Devin Silvia

Putting it all Together

t = 0.018 Gyr

z = 99.000

PROBLEM TYPES

- Need external initial conditions files
 - Cosmology
 - Turbulence
- Enzo initializes everything
 - spheres: rotating, collapsing, colliding
 - galactic disks
 - shock tubes
 - cloud crushing
 - gravity, hydro tests
 - many, many more

Image: Elizabeth Tasker

The Enzo Project

Aug 8 2013: Enzo 2.4 has been released. View the [Release Notes!](#) ✕

What is Enzo?

Enzo is a community-developed adaptive mesh refinement simulation code, designed for rich, multi-physics hydrodynamic astrophysical calculations.

Enzo is freely available, developed in the open, with a strong support structure for assistance. Simulations conducted with Enzo have been featured in numerous refereed journal articles, and it is capable of running on computers from laptop to Top500.

Getting Enzo

Enzo can be obtained in several places, corresponding to the degree of stability and development accessibility.

[Let's go! »](#)

Developing

Enzo is developed in the open by a community of developers from different institutions. Contributions, fixes, and changes are all welcomed!

Help!

There are several places to get help with Enzo, from mailing lists to documentation to online tutorials and recordings of workshop presentations.

2. Clone your fork, commit changes, push them to your fork.

DEVELOPMENT

The screenshot shows a Bitbucket pull request interface. At the top, the navigation bar includes 'Bitbucket', 'Dashboard', 'Teams', 'Repositories', and a 'Create' button. The current repository is 'owner/repository'. The pull request is titled '#254 OPEN' and is from 'enzo-dev_reynol...' to 'week-of-code'. Action buttons include 'Merge', 'Edit', 'Decline', and 'Approve' (with a '0' indicator). The pull request title is 'Minor FLD solver update to skip linear solve when possible'. The author is 'Daniel Reynolds'. The description is 'Updated gFLDSplit_Evolve() routine to skip the solve if possible (useful for reionization runs before stars are made)'. There are three comments. The first comment by 'Sam Skillman' includes a screenshot of a test failure: 'Items are not equal: Output times not equal. ACTUAL: 0.78000038133545'. The second comment by 'Daniel Reynolds' says 'Interesting! Actually it's not the dt, TimeUnits bit, since that happens at the end of the linear solve anyway. So if I skip the linear solve, I still need to scale the units back to their normalized values.' The third comment says 'Instead, it looks like in this test problem, the first few time steps meet the criteria for skipping the call to the HYPRE solver. Eventually, the species get enough out of equilibrium so that the solves kick in.'

Comments (3)

Sam Skillman
This ever so slightly breaks the tests in this way:

```
Items are not equal: Output times not equal.  
ACTUAL: 0.78000038133545  
EXPECTED: 0.0000000000000000  
http://srs.slac.stanford.edu/hudson/job/enzo-dev/141/testReport/
```

Daniel Reynolds
Interesting! Actually it's not the dt, TimeUnits bit, since that happens at the end of the linear solve anyway. So if I skip the linear solve, I still need to scale the units back to their normalized values.

Instead, it looks like in this test problem, the first few time steps meet the criteria for skipping the call to the HYPRE solver. Eventually, the species get enough out of equilibrium so that the solves kick in.

1. Create a fork of the main repository.
2. Clone your fork, commit changes, push them to your fork.
3. Issue a "pull request".

DEVELOPERS

Many people have contributed to the development of Enzo -- here's just a short list of the people who have recently contributed, in alphabetical order:

* Tom Abel	tabel@stanford.edu
* James Bordner	jobordner@ucsd.edu
* Greg Bryan	gbryan@astro.columbia.edu
* Renyue Cen	cen@astro.princeton.edu
* Dave Collins	dcollins@physics.ucsd.edu
* Brian Crosby	crosby.bd@gmail.com
* Nathan Goldbaum	goldbaum@ucolick.org
* Oliver Hahn	hahn@phys.ethz.ch
* Robert Harkness	harkness@sdsc.edu
* Elizabeth Harper-Clark	h-clark@astro.utoronto.ca
* Cameron Hummels	chummels@gmail.com
* Ji-hoon Kim	mornkr@ucolick.org
* Daegene Koh	dkoh30@gatech.edu
* Alexei Kritsuk	akritsuk@ucsd.edu
* Michael Kuhlen	mak@astro.berkeley.edu
* Eve Lee	elee@cita.utoronto.ca
* Yuan Li	yuan@astro.columbia.edu
* Michael Norman	mlnorman@ucsd.edu
* JS Oishi	jsoishi@gmail.com
* Brian O'Shea	oshea@msu.edu
* Pascal Paschos	ppaschos@minbari.ucsd.edu
* Carolyn Peruta	perutaca@msu.edu
* Alex Razoumov	razoumov@gmail.com
* Dan Reynolds	reynolds@smu.edu
